Settings menu brightness use case

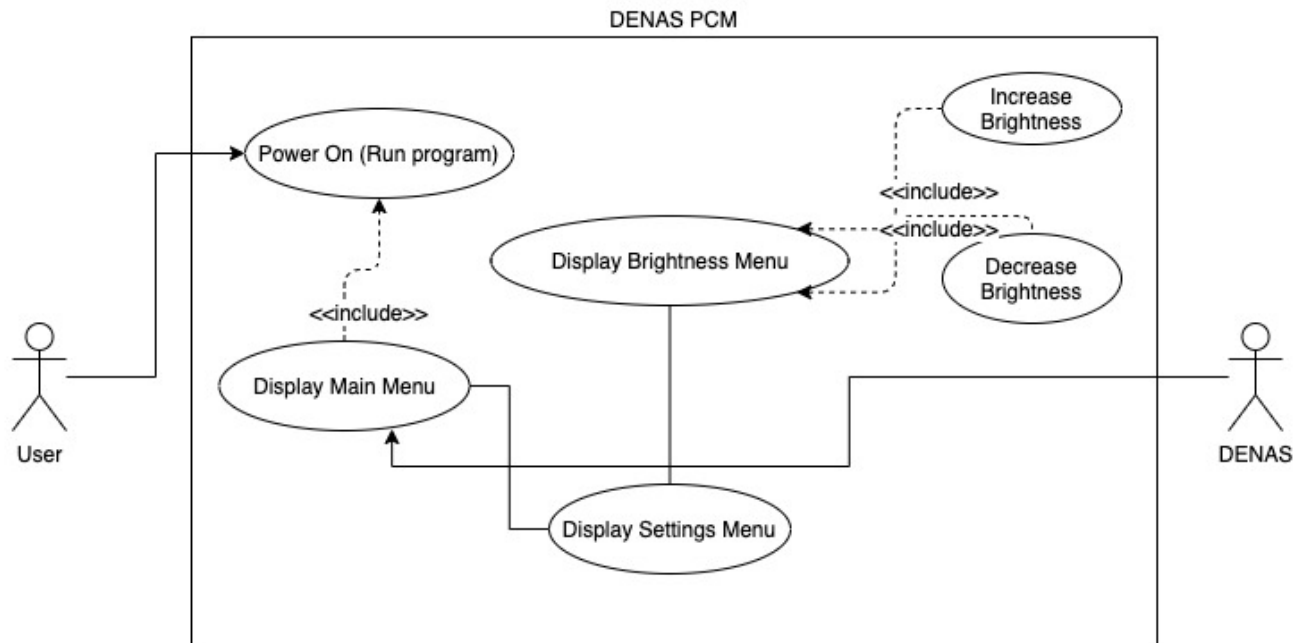

UCD 6: Settings Menu Use Case Diagram.

UCD 6 Illustrates a use case where the user actor chooses to access the settings with the goal of increasing or decreasing the brightness of the device. The flow of the diagram shows the user actor powering on the device (or running the program) prompting the DENAS program to display the main menu. Displaying the main menu therefore includes powering on the device. The user the then selects the settings option from the main menu. The program responds by displaying the settings menu. From the settings menu, the user actor then selects the brightness option. The program responds by displaying the brightness menu. The user actor can then choose to increase or decrease the brightness of the device by pressing the right and the left buttons on the device respectively. Increasing or decreasing the brightness of the device includes displaying the brightness menu because the brightness settings cannot be changed without first navigating to the brightness settings option for the device to display the brightness window.
